

# Access: First Function

---

In Access, the **First** function returns the first value from the result set of a query.

The syntax for the **First** function is:

First ( expression )

*expression* is the value that you'd like to return from the result set. The **First** function only returns the first value in the result set.

For example:

First (SupplierID)

In this example, the First function would return the first SupplierID value.

## SQL/Queries

You can use the **First** function in a query.
