

# Access: IsNull Function

---

In Access, the **IsNull** function returns TRUE if the expression is a null value. Otherwise, it returns FALSE.

The syntax for the **IsNull** function is:

IsNull ( expression )

*expression* is a variant that contains a string or numeric value.

For example:

IsNull (null)                      would return TRUE

IsNull ("Tech on the Net")    would return FALSE

## VBA Code

The **IsNull** function can be used in VBA code. For example:

```
Dim LValue As Boolean
```

```
LValue = IsNull("Tech on the Net")
```

In this example, the variable called LValue would contain FALSE as a value.

## SQL/Queries

You can also use the **IsNull** function in a query.
