

Access: Last Function

In Access, the **Last** function returns the last value from the result set of a query.

The syntax for the **Last** function is:

Last (expression)

expression is the value that you'd like to return from the result set. The **Last** function only returns the last value in the result set.

For example:

Last (SupplierID)

In this example, the Last function would return the last SupplierID value.

SQL/Queries

You can use the **Last** function in a query.
