

Access: CVar Function

Question: How do I convert a value to a variant?

Answer: To convert a value to a variant, use the "CVar" function. The syntax for the CVar function is:

```
CVar( expression )
```

For example:

```
Dim LValue As Variant
```

```
LValue = CVar(8)
```

The variable called LValue would now contain the variant value of "8".
