

Access: Date Function

In Access, the **Date** function returns the current system date.

The syntax for the **Date** function is:

Date ()

For example:

Date() would return a value such as '22/11/2003'

VBA Code

The **Date** function can be used in VBA code. For example:

```
Dim LDate As String
```

```
LDate = Date
```

In this example, the variable called LDate would now contain the current system date.

SQL/Queries

You can also use the **Date** function in a query.
