

Access: TimeValue Function

In Access, the **TimeValue** function converts a string to a time.

The syntax for the **TimeValue** function is:

TimeValue (string_time)

string_time is a string representation of a time. *string_time* can be a time ranging from 0:00:00 to 23:59:59. *string_time* can be entered in either 12-hour or 24-hour clock notation.

For example:

TimeValue ("3:12:57 PM") would return 3:12:57 PM

TimeValue ("15:12:57") would return 3:12:57 PM

VBA Code

The **TimeValue** function can be used in VBA code. For example:

```
Dim LTime As Date
```

```
LTime = TimeValue ("18:30:12")
```

In this example, the variable called LTime would now contain the value of 6:30:12 PM.

SQL/Queries

You can also use the **TimeValue** function in a query.
