

# Access: DLast Function

---

In Access, the **DLast** function returns the last value from a specified set of records (or domain).

The syntax for the **DLast** function is:

DLast ( expression, domain, [criteria]

*expression* is the field from which you want the last value.

*domain* is the set of records. This can be a table or a query name.

*criteria* is optional. It is the WHERE clause to apply to the *domain*.

For example:

Let's take a look at a simple example:

DLast("UnitPrice", "Order Details", "OrderID = 10248")

In this example, you would retrieve the last UnitPrice value in the Order Details table where the OrderID is 10248.

## VBA Code

The **DLast** function can be used in VBA code. For example:

Dim LTotal As Currency

LTotal = DLast("UnitPrice", "Order Details", "OrderID = 10248")

In this example, the variable called LTotal would now contain the last UnitPrice from the Order Details table where the OrderID is 10248.

## SQL/Queries

You can also use the **DLast** function in a query.
