

Access: CurDir Function

In Access, the **CurDir** function returns the current path.

The syntax for the **CurDir** function is:

CurDir (drive)

drive is an optional parameter. If this parameter is omitted, the CurDir function assumes the current drive.

For example:

CurDir () would return "C:\Documents and Settings\user\My Documents"

CurDir ("G") would return "G:\"

VBA Code

The **CurDir** function can be used in VBA code. For example:

```
Dim LResult As String
```

```
LResult = CurDir ()
```

In this example, the variable called LResult would now contain the value "C:\Documents and Settings\user\My Documents".

SQL/Queries

You can also use the **CurDir** function in a query.
